

# FAE – AE with First-Class Functions

## 1 INTRODUCTION

FAE is a toy language for the [COSE212](#) course at Korea University. FAE stands for an extension of the [AE](#) language with **first-class functions**, and it supports the following features:

- **integers**
- **basic arithmetic operators**: addition (+) and multiplication (\*)
- **first-class functions**

This document is the specification of FAE. First, Section 2 describes the concrete syntax, and Section 3 describes the abstract syntax. Then, Section 4 describes the big-step operational (natural) semantics of FAE.

## 2 CONCRETE SYNTAX

The concrete syntax of FAE is written in a variant of the extended Backus–Naur form (EBNF). The notation `<nt>` denotes a nonterminal, and `"t"` denotes a terminal. We use ? to denote an optional element and + (or \*) to denote one or more (or zero or more) repetitions of the preceding element. We use **butnot** to denote a set difference to exclude some strings from a producible set of strings. We omit some obvious terminals using the ellipsis (...) notation.

```
// basic elements
<digit>    ::= "0" | "1" | "2" | ... | "9"
<number>   ::= "-"? <digit>+
<alphabet> ::= "A" | "B" | "C" | ... | "Z" | "a" | "b" | "c" | ... | "z"
<idstart>  ::= <alphabet> | "_"
<idcont>   ::= <alphabet> | "_" | <digit>
<id>       ::= <idstart> <idcont>*

// expressions
<expr>     ::= <number> | <expr> "+" <expr> | <expr> "*" <expr> | <id>
              | "(" <expr> ")" | "{" <expr> "}"
              | <id> ">" <expr> | <expr> "(" <expr> ")"
```

The precedence and associativity of operators are defined as follows:

Operator	Associativity	Precedence
*	left	1
+	left	2

## 3 ABSTRACT SYNTAX

The abstract syntax of FAE is defined as follows:

Expressions	$\mathbb{E} \ni e ::= n$	(Num)	
	$  e + e$	(Add)	
	$  e \times e$	(Mul)	
	$  x$	(Id)	
	$  \lambda x. e$	(Fun)	
	$  e(e)$	(App)	
		where	
		Integers	$n \in \mathbb{Z}$ (BigInt)
		Identifiers	$x \in \mathbb{X}$ (String)

## 4 SEMANTICS

We use the following notations in the semantics:

$$\begin{array}{lll}
 \text{Values} & \mathbb{V} \ni v ::= n & (\text{NumV}) \\
 & | \langle \lambda x.e, \sigma \rangle & (\text{CloV}) \\
 \text{Environments} & \sigma \in \mathbb{X} \xrightarrow{\text{fin}} \mathbb{V} & (\text{Env})
 \end{array}$$

The big-step operational (natural) semantics of FAE is defined as follows:

$$\boxed{\sigma \vdash e \Rightarrow v}$$

$$\begin{array}{c}
 \text{Num} \frac{}{\sigma \vdash n \Rightarrow n} \\
 \\
 \text{Add} \frac{\sigma \vdash e_1 \Rightarrow n_1 \quad \sigma \vdash e_2 \Rightarrow n_2}{\sigma \vdash e_1 + e_2 \Rightarrow n_1 + n_2} \quad \text{Mul} \frac{\sigma \vdash e_1 \Rightarrow n_1 \quad \sigma \vdash e_2 \Rightarrow n_2}{\sigma \vdash e_1 \times e_2 \Rightarrow n_1 \times n_2} \\
 \\
 \text{Id} \frac{x \in \text{Domain}(\sigma)}{\sigma \vdash x \Rightarrow \sigma(x)} \\
 \\
 \text{Fun} \frac{}{\sigma \vdash \lambda x.e \Rightarrow \langle \lambda x.e, \sigma \rangle} \\
 \\
 \text{App} \frac{\sigma \vdash e_0 \Rightarrow \langle \lambda x.e_2, \sigma' \rangle \quad \sigma \vdash e_1 \Rightarrow v_1 \quad \sigma'[x \mapsto v_1] \vdash e_2 \Rightarrow v_2}{\sigma \vdash e_0(e_1) \Rightarrow v_2}
 \end{array}$$

### 4.1 Dynamic Scoping

The above semantics is defined with **static scoping** (or **lexical scoping**). We can augment it with **dynamic scoping** by changing the rule for function application as follows:

$$\text{App} \frac{\sigma \vdash e_0 \Rightarrow \langle \lambda x.e_2, \sigma' \rangle \quad \sigma \vdash e_1 \Rightarrow v_1 \quad \sigma[x \mapsto v_1] \vdash e_2 \Rightarrow v_2}{\sigma \vdash e_0(e_1) \Rightarrow v_2}$$
