

AE – Arithmetic Expressions

1 INTRODUCTION

AE is a toy language for the [COSE212](#) course at Korea University. AE stands for a language of arithmetic expressions that supports the following features:

- **number (integer) values** ($0, 1, -1, 2, -2, 3, -3, \dots$)
- **arithmetic operators**: addition (+) and multiplication (*)

This document is the specification of AE. First, Section 2 describes the concrete syntax, and Section 3 describes the abstract syntax. Then, Section 4 describes the big-step operational (natural) semantics of AE.

2 CONCRETE SYNTAX

The concrete syntax of AE is written in a variant of the extended Backus–Naur form (EBNF). The notation `<nt>` denotes a nonterminal, and `"t"` denotes a terminal. We use `?` to denote an optional element and `+` (or `*`) to denote one or more (or zero or more) repetitions of the preceding element. We omit some obvious terminals using the ellipsis (`...`) notation.

```
// basic elements
<digit> ::= "0" | "1" | "2" | ... | "9"
<number> ::= "-"? <digit>+

// expressions
<expr> ::= <number> | <expr> "+" <expr> | <expr> "*" <expr> | "(" <expr> ")"
```

The precedence and associativity of operators are defined as follows:

Operator	Associativity	Precedence
*	left	1
+	left	2

3 ABSTRACT SYNTAX

The abstract syntax of AE is defined as follows:

Expressions $\mathbb{E} \ni e ::= n$ (Num)
 | $e + e$ (Add) where Numbers $n \in \mathbb{Z}$ (BigInt)
 | $e * e$ (Mul)

4 SEMANTICS

The big-step operational (natural) semantics of AE is defined as follows:

$$\boxed{\vdash e \Rightarrow n}$$
$$\text{Num} \frac{}{\vdash n \Rightarrow n} \quad \text{Add} \frac{\vdash e_1 \Rightarrow n_1 \quad \vdash e_2 \Rightarrow n_2}{\vdash e_1 + e_2 \Rightarrow n_1 + n_2} \quad \text{Mul} \frac{\vdash e_1 \Rightarrow n_1 \quad \vdash e_2 \Rightarrow n_2}{\vdash e_1 * e_2 \Rightarrow n_1 \times n_2}$$

The equivalent small-step operational (reduction) semantics of AE is defined as follows:

$$\begin{array}{c}
 \frac{e_1 \rightarrow e'_1}{e_1 + e_2 \rightarrow e'_1 + e_2} \qquad \frac{e_2 \rightarrow e'_2}{n_1 + e_2 \rightarrow n_1 + e'_2} \qquad \frac{}{n_1 + n_2 \rightarrow n_1 + n_2} \\
 \\
 \frac{e_1 \rightarrow e'_1}{e_1 * e_2 \rightarrow e'_1 * e_2} \qquad \frac{e_2 \rightarrow e'_2}{n_1 * e_2 \rightarrow n_1 * e'_2} \qquad \frac{}{n_1 * n_2 \rightarrow n_1 \times n_2}
 \end{array}$$
